Global Futures: **Now**

“Good intentions won't halve emissions this decade or save lives right now.” UN Climate Change Executive Secretary Simon Stiell

Another United Nations Climate Change Conference (COP28) has passed and the consensus on what was accomplished is still being debated.

Between November 30 and December 12, more than 80,000 attendees arrived in Dubai, United Arab Emirates. The Julie Ann Wrigley Global Futures Laboratory hosted a pavilion in the Blue Zone, with delegates, project partners and guests delivering presentations and moderating conversations on topics ranging from the [role of climate youth activists](#) to [women leaders in climate action](#). We also showcased the [10 New Insights in Climate Science](#) and the [10 Must-haves](#) that have resulted from the Global Futures Conferences of 2022 and 2023.

Throughout the conference, representatives from nearly 200 nations convened on how to keep the global temperature limit of 1.5°C within reach and ultimately agreed to transition away from fossil fuel use.

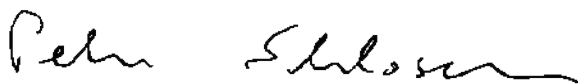

The culminating text from these negotiations is a partial win for proponents of climate action. More than 100 countries lobbied for a strong statement that would signal to investors and policy-makers a desire to phase out the use of fossil fuels - oil, gas and coal. For the first time language addressing this demand was included in the final conference agreement. The move towards transitioning away from fossil fuels as the primary source of energy reflects the belief that climate change is a global concern and that concrete solutions to mitigate the effects of warming temperatures must be achieved on a global scale.

Yet, while many hailed the agreement on transitioning away from fossil fuels as a landmark deal, there is also considerable concern over the softening of some of the language after the initial draft. Representatives from island nations expressed frustration at being left out of the conversation when the final deal was reached, calling the outcome inequitable as it is their communities who are disproportionately affected by climate change caused by the world's top producers of greenhouse gas emissions. The final agreement calls for a “transition away” from fossil fuels, to triple renewable energy capacity and double the rate of energy efficiency improvements by 2030. Only time – which is running out quickly – will tell if this agreement will achieve the intended goals.

Another major development at this year's conference was the announcement that [the loss and damage fund had been established](#). This fund is intended to support developing countries in preparing communities for damage caused by climate change. Pledges amounting to \$700million were made by developed countries, including the United Arab Emirates, Germany, Italy, France, and the United States. This amount, however, is only a fraction of the economic and non-economic losses developing nations experience every year. To put it in perspective, the estimated amount needed to support vulnerable nations bearing the brunt of global extremes is greater than [\\$400billion a year and rising](#). Few countries have released details of the nature and timing of their pledged funds, resulting in a missed opportunity to design a concrete solution. The slow pace of committing resources to the fund coupled with the delay in establishing the fund speaks to the struggle by developed nations to address the impact experienced around the world as a result of climate change.

Given the extremes of 2023 – including the Maui wildfires, the floods in Eastern Libya and record-breaking heatwaves such as what we experienced in Phoenix – securing agreements with strong language, actionable solutions and concrete timelines is the only way to address the global climate crisis effectively. The scientific case for moving toward clean and renewable energy sources has been established and solutions to the climate crisis are also available and are waiting to be scaled up. Such solutions include the Global Futures Laboratory's efforts around direct air capture and clean hydrogen.

While this year's COP made progress in curbing global warming, it will not keep us from passing the 1.5°C target. The question is no longer if we can halt global warming at 1.5°C but how large the overshoot will be and for how long we will be in an overshoot phase. What cannot be denied about the conference is [its power to bring people together to elevate the conversation on climate change](#). This is why the Global Futures Laboratory must continue to participate in conferences such as COP so that our expertise and knowledge are part of the critical discourse about the future of our planet's life-supporting systems and all life that depends on them.

Peter Schlosser

Global Futures Laboratory at COP28

The 28th convening of the United Nations Conference of Parties of the UNFCCC, or COP28, ran from Nov. 30 - Dec. 12 in Dubai, United Arab Emirates, with the Julie Ann Wrigley Global Futures Laboratory hosting a pavilion in the Blue Zone. We invite you to watch the recorded series of presentations and conversations around addressing the challenges human activity has brought upon our planetary systems and learn more about the delegation of ASU representatives on the ground in Dubai.

40-year study charts oceans in peril

A [recent paper](#) from the team at the Bermuda Institute of Ocean Sciences was published in the current issue of the journal *Frontiers in Marine Science*. The paper provides the longest sustained time series in the global ocean, tracking critical ocean trends over four decades. The comprehensive study shows a rise in surface ocean temperature of about 1 degree Celsius (1.80 F). The ocean acidity and salinity have also risen by 30% and 0.136 parts per thousand, respectively, according to the findings.

Study models strategies to alleviate extreme heat in specific U.S. cities through the end of the century

New research published in *Nature Cities* examines the potential benefits of combining heat adaptation strategies — such as implementing cool roofs and planting street trees — with mitigation strategies to lessen heat exposure across major U.S. cities.

[Matei Georgescu](#), lead author of the paper and a Senior Global Futures Scientist, also identifies the regions in which these strategies could best benefit future populations.

Research: Alleviating water

scarcity by optimizing crop mixes

Yufei Zoe Ao, a postdoctoral research scholar in the School of Sustainability, was an author in a recent study published in *Nature Water*. The study, which is currently subscription-access-only, demonstrates the interconnectedness of crop production and freshwater availability and offers a more water-secure path forward.

Assistant Research Professor Jesse Senko named recipient of \$100,000 Theodore Roosevelt Genius Prize

[Jesse Senko](#) received a \$100,000 Theodore Roosevelt Genius Prize from the U.S. Fish and Wildlife Service for his development of a solar-powered light that doubles as a buoy to reduce bycatch of endangered sea turtles, sharks and marine mammals while maintaining target fish catch. The innovation is lifesaving for the marine animals it protects — and immediately implementable for fishers using their existing fishing gear.

College of Global Futures partners with game-based learning platform Kahoot

ASU has partnered with Kahoot! to develop a new collection of quizzes on the game-based learning platform, inspired by the College of Global Futures' four schools. Topics cover the impacts of rising temperatures on the human body, coral reef conservation, innovations in wearable technology and the importance of rainforests for our global future.

Meet our Outstanding Graduates

A new cohort of future leaders and changemakers walked across the stage at ASU Gammage on Dec. 14 to receive their diplomas. Of this group, five were nominated as Outstanding Graduates:

- Don Christoff, Innovation in Society B.A. (SFIS)
- Claudia Lumbi, Sustainability B.A. (SOS)
- Jamie Winterton, Human and Social Dimensions of Science and Technology Ph.D. (SFIS)
- Jake Swanson, Sustainability M.S. (SOS)
- Robin Berry, Biomimicry M.S. (SCAS)

[Robin Berry](#), [Don Christoff](#) and [Jamie Winterton](#) were featured in the ASU News wrap-up of notable graduates across campus.

Global Futures Viewbook

We must rediscover our planet and our relationship with it.

What does this mean, exactly? For the faculty, students, researchers and global partners of the Julie Ann Wrigley Global Futures Laboratory, it means a commitment to urgently exploring pathways to impactful solutions and decisions that address the challenges we have caused through resource extraction and thoughtless consumption as part of a relentless pursuit of “progress.”

We believe better is possible.
